

## NiteTalk: Sleepwalking to Beethoven

By: John Hood

*Schneebett* at the Berliner Philharmonie, 2004

Last night a large contingent of our town's most active and illustrious art ops swarmed Miami Art Museum to celebrate the opening of Cuban-born conjurer Enrique Martínez Celaya's *Schneebett*. Among those on hand were the Rubell Collection's Donald and Mera Rubell, the Bass Museum's Megan Riley, gallerist Carol Jazzar, ace publicist Cece Feinberg, perennial scene-maker Myra Wexler, Whale & Star's Tessa Blumenberg, Peter Tunney Experience chief Carl Hildebrand and Flavorpill Miami's Omar Sommereyns, not to mention the usual assortment of MAM magnificos, including Tracy Belcher and Naomi Patterson, as well as Senior Curator Peter Boswell and Director Thom Collins, both of whom led the festivities with prescient opening remarks.

**What they saw:** *Schneebett* ("Snow-bed"), a three-part installation consisting of "a long narrow corridor that contains an electric compressor and water tower; an empty "antechamber" occupied by a single chair and a poem by Martínez Celaya entitled "Poisonwood" scrawled on the wall; and a room containing a sculptured bed and a large painting of a snowy forest landscape."

**What they heard:** Beethoven's Quartet No 15 in A Minor, Op 132, subtitled "A Sacred Song of Thanks from One Made Well, to the Divine, in the Lydian Mode," performed by members of the Miami Symphony Orchestra. As Matthew Taylor wrote in the program notes: "Just before he wrote this quartet, a very ill Beethoven was convinced that he was on the brink of death. When his health suddenly improved enough for him to work again, this is the music he wrote."

**What they experienced:** A near-mystic meditation on Beethoven's mythic last days, which were spent in Vienna, far from his Bonn birthplace.

Enrique Martínez Celaya's *Schneebett* will be on exhibit at MAM through January 1, 2012.

Netatalk needs to map IDs to files and folders in the host filesystem. To achieve this, several different CNID backends are available and can be chosen by the cnid scheme option in the afp.conf(5) configuration file. A CNID backend is basically a database storing ID <-> name mappings. The CNID Databases are by default located in /var/netatalk/CNID. There is a command line utility called dbd available which can be used to verify, repair and rebuild the CNID database. Note. There are some CNID related things you should keep in mind when working with netatalk

The package supports AppleShare IP and classic Appletalk protocols. With netatalk, Macintosh computers can mount Unix volumes and print to Unix print spools as if they were standard Appletalk network devices. Netatalk is brought to you by our friends at The Research Systems Unix Group at The University of Michigan. [netatalk@umich.edu]. The original netatalk homepage is available at: [http://www.umich.edu/~rsug/netatalk/] The "old version" of this HOWTO that covers the original version of netatalk can be found at: [http://www.anders.com/projects/netatalk/old/]. Another place to look for netatalk info is Bill McGonigle's Faq-O-Matic at: [http://threepio.hitchcock.org/cgi-bin/faq/netatalk/faq.pl].
